

'ENABLING TRANSLATION OF INNOVATIVE MEDTECH RESEARCH'

Underpinning successful technology innovation and biomedical research translation is the acquisition of pertinent skills and knowledge by those involved in medical device design and development. In addition, the ability to access essential information at the point of need and capability to connect key players in industry, academia and clinical research is pivotal to fostering collaborative research.

ABOUT

MedTechTranslate, an online resource, is being designed to centralise the expertise necessary to support medical device translation and provide guidance and information to members on key concepts, including the regulatory, quality and clinical data requirements associated with bringing a medical device to market.

MedTechTranslate resources can be accessed in two formats. The first will allow users to bring together content thematically or by topic, with the second allowing for content to be phase, or stage-tailored, to reflect the developers journey from project initiation through to launch.

MedTechTranslate will also support access to a clinical expertise registry where members can request clinical input, advice or support from **MedTechTranslate** members with a medical background and expressed interest in, or experience of, supporting medical device development.

CRDI / CÚRAM PARTNERSHIP PROJECT

MedTechTranslate is an online initiative of the **CRDI / CÚRAM Partnership Project** with the aim to contribute to successful translation of research ideas and a more rapid journey of safe and effective medical devices to market. By increasing awareness of regulatory requirements, fostering interactions to harness knowledge and expertise and providing training and information tools, our aim is to establish best practice in medical device research translation. Significantly, our work is underpinned by constructive engagement with industry, regulators, academic researchers, clinicians and the national clinical research infrastructure.
